ReadMe file for Chen, "Team-Specific Human Capital and Team Performance: Evidence from Doctors"

This document describes the data and programs used in the paper referenced above.

Data

This paper uses the following data:

- 20 percent Medicare claims data: this is the main data used in the paper. Since the data are confidential, this paper is not able to post or share the data. Researchers interested in using the data can apply for their own copy of the data by obtaining a Data Use Agreement from the Centers for Medicare and Medicaid Services (CMS). Information is available at https://resdac.org (last accessed October 15, 2021). Obtaining a physical copy of the data involves a fee; the fee information is available at: https://resdac.org/cms-fee-information-research-identifiable-data (last accessed October 15, 2021).
- Medicare Data on Provider Practice and Specialty (MD-PPAS): the data is not publicly available but can be applied along with the Medicare claims data.
- Physician Compare: publicly available at https://data.cms.gov/provider-data/archived-data/doctors-clinicians (last accessed October 15, 2021). The data is also available at DOI: https://doi.org/10.3886/E149961V1 (last accessed October 15, 2021).
- ICD 9 to ICD 10 crosswalk: publicly available at the NBER Public Use Data Archive https://www.nber.org/research/data/icd-9-cm-and-icd-10-cm-and-icd-10-pcs-crosswalk-or-general-equivalence-mappings (last accessed October 15, 2021).

Computational Requirements

- Software requirements: the analyses are run on Stata, version 14. The following packages are installed for analyses:
  - binscatter (as of 01/30/2019)
  - rangejoin (as of 04/23/2021)
  - rangestat (as of 01/15/2019)
  - reghdfe (as of 02/02/2019)

- Memory and runtime requirements: The process that builds the final analysis datasets takes approximately five days. The analyses that generate the tables and figures in the main article and the appendix take approximately one and fifteen days, respectively. No special memory requirement was encountered during the analysis process.

Description of Code

The following is the code for analyses. Since the format of the Medicare data may vary across versions, researchers interested in replicating the analysis may need to adjust the code to the format of their own copy of the data:

- master.do calls other .do files to generate the analysis datasets and all the figures and tables reported in the paper.
- gen_01_data_preparation.do builds data (e.g., death dates, inpatient stays) for analysis.
- gen_02_identify_doctors.do extract claims for identifying the proceduralists and physicians who treat the patient.
- gen_03_experience.do generates various measures of experience, including shared work experience, individual work experience, and hospital-specific experience.
- gen_04_doctor_characteristics.do identifies doctors' characteristics.
- gen_05_merge.do merges data for constructing the final analysis datasets.
- gen_06_generate_outcomes_controls.do generates outcome and control variables.
- gen_07_analysisdata.do creates the final analysis datasets for generating the tables and figures in the paper.
- analysis_01_figure_1-4.do generates the figures reported in the main article.
- analysis_02_table_1-7.do generates the tables reported in the main article.
- analysis_03_figure_A1-A5.do generates online Appendix Figures A1-A5.
- analysis_04_table_A1-A5.do generates online Appendix Tables A1-A5.
- analysis_05_table_A6-A10.do generates online Appendix Tables A6-A10.
- analysis_06_table_A11-A15.do generates online Appendix Tables A11-A15.
- analysis_07_table_A16-A22.do generates online Appendix Tables A16-A22.
